

IN THE ABSTRACT:

Please amend the Abstract of the Disclosure with the following:

This invention has as its object to allow a direct print system to display on a user interface of a digital camera whether or not a printer which can directly communicate with the digital camera has a function of automatically detecting a paper size and the like. To this end, according to this invention, in a print system that includes a digital camera, and a printer which can directly communicate with the digital camera, the printer has transmission means for transmitting information indicating that it has a function of automatically detecting the paper size and type to the digital camera, and the digital camera has a user interface for notifying the user that the printer has that function: A digital camera can directly communicate with a printer. The digital camera includes a receiving unit, a determination unit and a user interface. The receiving unit receives capability information of the printer from the printer. The determination unit (a) determines, according to the received capability information, whether the printer has a first function of automatically detecting a paper size, and (b) determines, according to the received capability information, whether the printer has a second function of automatically detecting a paper type. The user interface notifies a user that the printer has the first and second functions if the determination unit determines that the printer has the first and second functions.
